## Technical Bulletin

TB-1001

### “Long Life Timing Systems”

At PCI we constantly strive to maintain a high level of quality in all of our timing products. This bulletin proudly announces a change with regard to our timing chains. We have been migrating to “fine finish chains” for both for roller & silent style applications. Fine finish means the chain’s edges that press and rub against the Tensioner and, or guide rails are smooth. See the comparing photos below. Fine finish chains have a dramatic impact on the lifespan of both the Tensioner and guide rails. While most new applications are produced with fine finish chains, we have adopted the fine finish chains for the earlier applications wherever possible.

**It is easy to see the difference and the advantage is obvious**

Quality, Coverage & Value has always been important at PCI. We pride ourselves in being the quality leader in the industry. Sometime it is this obvious, sometimes not. Let PCI be your partner in quality. It is a quality difference you and your customers can rely on.
